

Elevate Your Organization's Efficiency with Strategic Energy Management

Don't just change the way you use energy—change the way you think about energy.

The PSE&G Business Energy Saver Strategic Energy Management (SEM) program takes a holistic approach to improving your organization's energy efficiency by helping you build smart energy practices into every aspect of your organization, including your company culture. We help you develop measurable long-term savings by focusing on the systems and processes you already have in place and identifying opportunities to optimize energy usage.

How We Do It

Beginning with a comprehensive energy assessment, we work with your facility managers and leadership team to get your organization on the path to continuous improvement. Through workshops, webinars, and group and individual trainings, we'll help your team to set energy performance goals, then develop benchmarks and tracking systems to monitor progress.

The Strategic Energy Management (SEM) program is available to both commercial and industrial (C&I) customers who are:

- + Either an electric and/or natural gas customer of PSE&G who contributes to the Societal Benefit Charge associated with these services.
- + A customer who consumes in excess of 5,000,000 kWh, or 300,000 Therms at one or more facility and/or site managed by the same customer is eligible for the program.

Get Started

Request your free energy assessment today and a member of our team will work with you to determine your eligibility and schedule a visit to your facility.

Optimize Efficiency in Existing Facilities Through Retro-Commissioning

Don't just make the best of what you've got—make what you've got, the best.

The PSE&G Business Energy Saver Retro-Commissioning (RCx) program works to optimize the efficiency of your facility's existing systems and equipment by resolving energy performance issues that can arise from operational and occupancy changes to a facility over time. RCx helps to properly integrate your facility's mechanical, electrical and control systems so they can perform together at peak efficiency, to meet your facility's operating requirements while also optimizing energy usage.

How We Do It

Working with your facility managers and leadership team, we perform a comprehensive energy assessment to identify operations and maintenance improvements that will ensure optimal performance of your existing building systems and system interactions.

The Retro-Commissioning (RCx) program is available to both commercial and industrial (C&I) customers who are:

- + Either an electric and/or natural gas customer of PSE&G who contributes to the Societal Benefit Charge associated with these services.
- + A customer who consumes in excess of 2,500,000 kWh, or 150,000 Therms at one or more facility and/or site managed by the same customer is eligible for the program.
- + A customer who has a functioning Direct Digital Control (DDC) Building/Energy Management System capable of employing trend data to monitor systems to be impacted. Further, participants energy consumption must exceed ten percent (10%) of industry averages as established by the current release of Commercial Building Energy Consumption Survey (CBECS) data for similar building uses on a square foot basis during the most recent twelve-month period.
